Taylor Farms celebrating steps to a sustainable future

April 17, 2017

Taylor Farms has announced a new renewable and alternative energy system at its Gonzales, CA, facility. This three-tiered system will utilize wind, solar and cogeneration energy to help Taylor Farms

in its goal to power a sustainable future.

This newest initiative will offset energy usage at the fresh foods processing plant by an average of 90 percent, and the system is 21 percent cleaner than a utility grid.

Taylor Farms said its investments in sustainability projects have been widely embraced by customers and partners nationwide. The company plans to continue pursuing opportunities to lead renewables projects across North America, with each project taking it one step further in its dedication to minimizing Taylor's environmental footprint, while delivering healthy fresh foods to consumers.
